RESEARCH INTERESTS

My main research interests focus on the diversity and ecology of marine phytoplankton, with particular interest in their life cycles and the role they play in species ecology, population dynamics and genetic structure.

I have applied classical morpho-taxonomy approaches combined with molecular methods . including HTS metabarcoding - to investigate macro- and micro-evolutionary mechanisms that shape the diversity of microalgae.

The life cycle of unicellular microalgae includes distinct phases: active growth, dormant or quiescent stages, and sexual reproduction. In collaboration with PhD students, post-docs and various colleagues we investigate the exogenous and/or endogenous factors that regulate the transition between different life phases with integrated approaches spanning from *in situ* observations, laboratory experiments, functional genomic studies (on the marine diatom *Pseudo-nitzschia multiseries*), and modeling.
